Originally from China - in UK for 5 years.
Works as a data analyst for an AI company
Previous smoker
No alcohol
Single, no children

Family History:

Father - lung cancer
Mother - breast cancer

Performance Status: 0

Mr Jialin (Zak) Yang is a 38 year old patient who I saw as a new patient at the LOC Harley Street today. We were joined by our specialist nurse Kristina Torralba.

I have already seen Jialin yesterday in my NHS practice at St Barts Hospital where I told him that his cancer is incurable and that treatment is with chemotherapy. I talked him through common side effects of FOLFIRI chemotherapy again today. These include tiredness, diarrhoea, nausea and vomiting and skin changes. Potentially severe side effects are infection, heart problems and blood clots. There is also a small risk of death from side effects. I informed him about potential infertility after chemotherapy but he declined sperm banking. He was happy to consent for the chemotherapy and he knows that we will modify this to FOLFIRI Cetuximab if his tumour is RAS/BRAF wild type or FOLFOXIRI Bevacizumab if it has a mutation in these genes.

We will arrange Port insertion and aim to start the first cycle of FOLFIRI on 08/03/2024. I will also review his case in our MDT next week. DPD and virology test results have been done or are ongoing at St Barts and we will get the results over in the next few days. I am planning to see Jialin again in 3 weeks prior to his second cycle of chemotherapy.

With kind regards

Yours sincerely,

Professor Marco Gerlinger
